Collection Date & Time : 18/02/2023 12:40:55

Reporting Date & Time : 18/02/2023 14:22:56

Name : : SWATHI S

Age & Sex : 23 Years ; Female

MRD No: : RH00978683

Ref.Dr : : OBG UNIT - 3

Ward :

Sample ID : 2160591

PATHOLOGY

FNA NO - 45/23

Sample Received Date :15-02-2023

Site of FNAC : RIGHT BREAST

On Examination : Two tense, tender, mobile, soft to firm cysts in the Right breast, larger one measuring about 3 cm in maximum dimension in the retroareolar region and central quadrant, smaller measuring about 2 cm in maximum dimension in the lower outer quadrant.

Microscopy: Multiple smears studied from centrifuged sediments of cyst fluid are paucicellular and shows only proteinaceous background with inflammatory cells, predominantly neutrophils. Also seen are occasional cyst macrophages and RBC's. There is no evidence of ductal epithelial cells in the smears studied.

IMPRESSION : FNAC Right breast cystic lesion shows - Features are suggestive of cyst fluid only, unassessable for epithelial elements.

Note : Suggested clinicoradiological correlation.
